Difference

(In making an orthographic projection, any point in the object is mapped onto the drawing by dropping a perpendicular from that point to the plane of the drawing.) An isometric projection results if the plane is oriented so that it makes equal angles (hence “isometric,” or “equal measure”) with the three principal planes of the object.

Difference Orthographic drawings show a three-dimensional object in two dimensions. It is a form of parallel projection, where the view direction is orthogonal to the projection plane resulting in every plane of the scene appearing in affine transformation on the viewing surface. So the difference between these drawings is that isometric drawing is when all three dimensions of an object are drawn at full scale rather than foreshortening them to the true projection while in oblique drawings, the width ...
