Within each type of design there is considerable flexibility in terms of choice of treatments and experimental conditions; however, standardized methods of statistical analysis are usually available. In particular, when experiments produce numerical data, they can often be analyzed using some form of the analysis of variance (ANOVA 1).

Recommendation 6 (Study Design/Analysis) We strongly suggest that trials aiming to assess the clinical benefit of a new therapy against MDRO pathogens should apply an HNTD if a priori power calculations indicate feasibility. Superiority trials for new antibacterials targeting MDROs are, in general, considered infeasible. It is usually impossible to select a MDRO subgroup at the time of randomization, because this usually occurs before standard organism susceptibility testing is available.

The design of experiments is the design of any task that aims to describe and explain the variation of information under conditions that are hypothesized to reflect the variation. The term is generally associated with experiments in which the design introduces conditions that directly affect the variation, but may also refer to the design of quasi-experiments, in which natural conditions that influence the variation are selected for observation. In its simplest form, an experiment aims at predic
